

Five key benefits of enhancing IBM Guardium with Imperva Data Security Fabric

Imperva Data Security Fabric integrates with your existing Guardium deployment to do more with less effort and expense.

1. Simplify & accelerate reporting & forensics

Complete reports in minutes instead of weeks, even across hundreds of databases. Imperva Data Security Fabric automates time consuming Guardium manual reporting and discovery procedures.

2. Streamline long term audit data retention

Automatically consolidate and store virtually unlimited data in place so you can eliminate the Guardium aggregation layer. Years worth of "live data" is accessible for discovery, reporting and forensics in seconds.

3. Extend data coverage- even to the cloud

Imperva Data Security Fabric was designed from the ground up to scale enterprise-wide and match the performance requirements of powerful modern databases, big data systems, and cloud database environments.

4. Automate risk and incident management

Imperva Data Security Fabric coverage, capacity and scalability provides visibility and insight into data risk exposure, and an automated workflow system eliminates the manual effort for risk remediation and incident resolution.

5. Transform Guardium with privacy and security

Augment compliance functions with advanced security capabilities that satisfy privacy requirements and analyze Guardium audit data to detect complex threats Guardium can not, such as compromised accounts or malicious insider activity.
